VOL XXVI NUMBER 1 DEC 2021

Rhode Island ended 2021 on a high note, as the Current Conditions Index remained in expansion territory for the ninth consecutive month, ending with a strong value of 92 (compared to 25 last December) as all but one indicator improved relative to a year ago. The pandemic-based contraction was very severe, but areas of Rhode Island's economy have come back strongly, I think. My equivocation is related to the fact that we know much of the currently released labor market data contains substantial "project" and coaccerate adjuctment, related distortions, which has "noise" and seasonal adjustment-related distortions, which has been most visible in the claims data. The good news is that this uncertainty will be removed next month when the revised (rebenchmarked) labor market data are released. While I expect a number of the employment changes to be upward revisions, there is no way to be certain at this time. It is not inconceivable that the early pandemic months will be revised lower but the more recent months shown to contain higher employment. What happens to the Labor Force and Unemployment Rate are of particular interest, since we know there has been a great deal of self-employment, which raises resident employment and has distorted the existing data. Will all of this somehow paint a different picture? We will have to wait to see. Please note that whatever data revisions occur will affect both the regular and monthly Current Conditions Index values. Hopefully, the recent deterioration reflected in the monthly CCI will not be as severe or consistent. One thing is for sure: As we move farther into 2022, the "comps" will become increasingly difficult, so don't expect CCI values as high as those we have seen to date as 2022 unfolds.

As December data are the farthest from known values and the most likely to be altered by the upcoming data rebenchmarking, let me reflect on what the existing data show for the various CCI indicators, extending from January through December of 2021. The star performer by far and away has been **Retail Sales**. It

		Increased 12
CCI Indicators - % Cha	nge	times, ten of
Government Employment	4.9 Y	which were by
US Consumer Sentiment	-12.8	double-digits.
Single-Unit Permits	0.1 Y	
Retail Sales	9.9 Y	Wage also rose
Employment Services Jobs	1.1 Y	12 times, but its values are
Priv. Serv-Prod Employment	6.2 Y	related to
Total Manufacturing Hours	14.1 Y	compositional
Manufacturing Wage	9.1 Y	monthly
Labor Force	2.5 Y	changes in the various sub
Benefit Exhaustions	-77.6 Y	categories for
New Claims	-78.8 Y	that industry.
Unemployment Rate (change)	-3.1 Y	Total
Y = Improved Value	Manufacturing Hours was next	

with 10 improvements, most of which were double-digit increases occurring since April. What is impressive here is that both the workweek and employment have been rising throughout this period, reflecting manufacturing strength during some of the periods when the service sector weakened. Several indicators

improved 9 times, **Private Service Providing Employment**, which may ultimately be revised, the **Unemployment Rate**, **New Claims**, which are in the midst of massive revisions as fraudulent claims are removed, and **Singe-Unit Permits**, whose momentum clearly faded in the later parts of the year. **Benefit Exhaustions** rose 8 times as did the **Labor Force**, which began rising relative to a year ago in May. Will its increases be reversed as so often has happened in Rhode Island? **Government Employment** rose by 5 times, ending the year several thousand higher than it began the year after it resumed an upward trend starting in July. The "worst" performer was **US Consumer Sentiment**, which rose only 4 times (April through July) before returning to deteriorating values. The combination of weak sentiment and very strong **Retail Sales** is a very atypical combination.

All of this contrasts greatly with the picture that has been painted by the weak performances of the Monthly CCI. Since July, its values have been disappointing. How will the upcoming labor market revisions alter this? Possibly a great deal as there may well be a smoother set of monthly data changes in the revised data compared to those that exist with the current data and along
